

# $\delta^{13}\text{C}$ in $\text{CH}_4$ and $\text{CO}_2$ Gas Analyzer

PICARRO

- Only field-deployable analyzer for simultaneous high-precision  $\delta^{13}\text{C}$  measurements in  $\text{CH}_4$  and  $\text{CO}_2$
- Less calibration, less maintenance, no consumables
- Excellent precision at a fraction of IRMS operating cost

The **Picarro G2201-*i* Analyzer** can measure isotopic  $\text{CO}_2$  and  $\text{CH}_4$  simultaneously. Now it's easy and fast to capture the insights that only stable isotope ratios offer. Researchers can follow carbon as it moves from source to sink with a single instrument. The dual-purpose analyzer brings simplicity and speed to research. Its small size and robustness make it easy to transport to the field, where immediate results allow researchers to change course on-the-fly and achieve optimal results from limited-time field campaigns.

The analyzer operates in one of three modes: 1)  $\text{CO}_2$  only, 2)  $\text{CH}_4$  only and 3)  $\text{CO}_2$  and  $\text{CH}_4$  combined. In the combined mode, the measurement of  $\text{CO}_2$  and  $\text{CH}_4$  are interleaved every few seconds to produce a sampling rate that is faster than the gas turn-over time in the cavity. When the analyzer is in  $\text{CO}_2$ -only mode or  $\text{CH}_4$ -only mode, the precision improves, because more time is devoted to one molecule. In all modes, the analyzer precisely measures  $\text{CO}_2$ ,  $\text{H}_2\text{O}$  and  $\text{CH}_4$  concentrations, with fewer calibration events than other spectral absorption-based instruments.
